- (1) Equivalent lithium content for lithium-ion and lithium polymer cells and batteries is calculated in grams on a per cell basis to be 0.3 times the rated capacity in ampere hours. The equivalent lithium content for a battery or battery pack is the rated capacity in ampere-hours for single cell multiplied by 0.3 and then multiplied by the number of cells in the battery.
- (2) Note: The classification "Excepted from regulations" means that the product does not have to be packaged or shipped as a Class 9 hazardous material. However, for both "excepted" and "Class 9" products, there are various packaging, marking, labeling and shipping paper requirements based on lithium weight, equivalent lithium weight, energy content, cell or battery quantity and net or gross package weight, details of which are too numerous to include in the above tables. A complete description of transportation regulations and explanations of the transportation classifications, "Excepted" and "Class 9" is available on the Ultralife web site, <http://www.ultralifecorporation.com>.
