Here's what I had for power...

BTW, if I ever don't answer my phone, shoot me an e-mail for text...

[illegible]

All loaded with same firmware

With the PIC that came with the proto board:

Stirring controlled: 2.97 mW

“Off”: 0.99 mW

With “your” PIC:

Stirring controlled: 2.97 mW

"Off": 1.00 mW

Let me know what you think. We could spend a little more time and clock things down and reduce power if you'd like.
