

PR-2 Breadboard (Model II only)

The PR-2 makes connections to all connector areas on the Model II, and uses the J5 and J6 connections to decode the user hardware area of the Model II, providing four decoded chip select signals in this area. The EPROM which is normally socketed on the Tattletale is removed and reseated in the PR-2. The board provides a new set of connectors (all except J5 and J6) that will mate with a PR-1a or PR-1b.

**PR-3 Breadboard (Model III only)**

This breadboard is like the PR-2, except that it is designed to mate with the Model III.
