

Appendix C: Static Modeling results for various configurations of the Del Mar Mooring

These results show the effects of the static forcing (current and wind) on the system, and show how the mooring stretches out in various current/wind regimes. The various results compare the distribution of weight between the pig weight and the ESP assembly. In all cases the combination of in-water weights of the ESP assembly, the pig weight, and the cable and instruments place the ESP intake at approximately 15m depth.
