

# **The application of micro-Raman spectroscopy (and micro-LIBS) to the characterization of crystal structure variability in biogenic calcite**

**Timothy J. Shaw  
S. Michael Angel  
Christopher J. Hintz  
A. Chrissy Powell  
Marion J. Lawrence**

Department of Chemistry and Biochemistry, University of South Carolina

# Introduction

- **Rapid evaluation of intra-individual variability in Benthic Foraminifera**
- **Raman Spectroscopy**
  - ? Sensitive to Mg/Ca variation in calcite
- **Microscopic optics provides for micrometer resolution**

Tlili et al. 2003

? Identify Structural Variation in Biogenic Carbonates

Urmos et al., 1991

# Calcite Reference Material

# Aragonite Reference Material

# NIAIST - Magnesite( $\text{MgCO}_3$ ) China

# Calcite Reference Material

# Raman Spectroscopy Cont.

- **Unique Raman Spectra for each Substance**
  - ? Wavenumber Shift
  - ? Peak Width and Area

# Instrumentation

- **Jobin-Yvon Horiba LabRam Infinity micro-Raman Spectrometer**
  - ? 10 $\times$  objective (20- $\mu$ m spatial resolution)
  - ? Continuous Wave Laser Excitation
    - ? 532 nm frequency-doubled Nd:YAG
    - ? 785 nm diode laser
  - ? Programmable X-Y Stage
  - ? Four 15-30 s Exposures; 70  $\text{cm}^{-1}$  - 1250  $\text{cm}^{-1}$

# Sample Preparation

- **Cultured Benthic Foraminifera**

Havach et al., 2001

Hintz et al., 2004

- **Foraminiferal Cleaning**

- ? 5% NaOCl for 24 h

- ? 4' Methanol Rinses (2' 25 °C; 2' 60°C)

- ? 1:1 30% H<sub>2</sub>O<sub>2</sub> : 0.1 M KOH (60°C) for 10 m

- ? 0.25 M Citric Acid in 16 M NH<sub>4</sub>OH made up to 1 M  
in Hydrazine (60°C) for 2 m

Boyle and Keigwin, 1985 / 86

# Weaknesses of ns SP LIBS

- **Matrix effects**
- **Poor shot-to-shot reproducibility**
- **Poor ablative reproducibility**
- **Part-per-million limits of detection**

**Some of the weaknesses of single-pulse LIBS are improved using Dual-Pulse, and ultra-short (fs) pulse excitation.**

*Bulimina aculeata* test calcite 785 nm HeNe Laser excitation.

*B. aculeata* Raman spectrum (from Figure 1.) which has been background corrected and fit with Gaussian-Lorentzian distributions.

*B. aculeata* Raman  
Spectrum after  
photobleaching using a  
532nm frequency doubled  
Nd:YAG excitation.

The difference  
between  
long and  
short pulses

Ultra-short laser  
ablation  
improves the  
precision  
of material removal

Picosecond ablation for copper  
and glass samples.

Comparison of 7 ns and 1.3 ps excitation  
of glass craters

High precision material ablation using ps pulses

Craters appear very similar with ps excitation.

Reproducibility is very good using 140 fs excitation

**When using 140 fs excitation, the background is low enough to measure high-quality LIBS spectra without gating?**

**Background emission is very low**  
**using fs or ps pulse: no gating!**

Note: time scale difference

Background emission is very low  
using fs or ps pulse: no gating!

Note: time scale difference

# High Pressure SP-LIBS Spectra

Pressure appears to have little effect on SP-LIBS emission  
**Several analytes are observed at elevated pressures!**

## Single-Pulse LIBS Summary

- 1. Our SP high pressure measurements show we are currently able to detect Li, Ca, Na, K, Mn, Ba, Sr at pressures exceeding 272 atm (corresponding to an ocean depth of approximately 3000 meters).**
- 2. Pressure appears to have little effect on SP-LIBS measurements.**
- 3. Emission decay rates are unaffected by pressure.**
- 4. There are optimal ranges of laser pulse energies that provide the most intense analyte emission. The optimal ranges of laser pulse energies are element dependent but are not affected by pressure.**

We previously combined LIBS with Raman (Angel & Cremers). Here, LIBS gives the element (Ca, Mg), Raman gives the anion ( $\text{CO}_3^{2-}$ ,  $\text{SO}_4^{2-}$ )

# Our first microLIBS: (will combine mLIBS and mRaman)

*B. aculeata*

• LIBS gives minor element ratios: Mg/Ca, Sr/Ca, Ba/Ca

**Potential platforms:  
ships, moorings,  
sediment traps**

Miniature 0.3 J battery  
powered Nd:YAG laser.

# Other uses for microRaman/LIBS

- Measure dust/pollen particles in ice cores. (Global, paleo-climate research)
- Characterization of oceanic particulate phases
- Forensic residue/particle analysis

LIBS spectrum of  $\text{CaCO}_3$  particles (0.1 mg/mL) in ice taken using a single 20 mJ laser pulse. Atomic and ion lines are shown.

# Conclusions

- **Micro-Raman Spectroscopy**
  - ? **Rapid, non-destructive, high-spatial resolution**
  - ? **Intra-individual variability, inter-species comparisons**
  - ? **Cleaning procedure effects**
- **Mg/Ca incorporation alters Foraminiferal Calcite Crystal Structure**
  - ? **Single Carbonate Signature**
- **Calcite structure and composition can be monitored in-situ**

# **Future Development**

- **Mg/Ca Quantification using micro-Raman**
- **Dual micro-Raman / Laser induced Breakdown Spectroscopy (mR-LIBS)**
  - ? **Single instrument**
    - ? **Crystal structure**
    - ? **Minor-element ratios**
  - ? **Minimal sample preparation/cleaning**
    - ? **Limits procedural contamination and artifacts**
  - ? **Rapid analysis of Single Foraminifers**
