

MBARI Data Aggregation Strategy (Jan 12, 2007)

Use Case: For a property, get data from different platforms (e.g. AUV, ship and moorings) at a time where they were all collecting data from a common region.

Goal: Make MBARI's column's data available from one location to other communities.

Problems:

This is a non-funded project

Questions that need to be answer?

1. What is the functionality needed to be supported by an end user interface?
2. How do we use the available technologies (SSDS, MOQUA, OPENDAP, SOS) to make available that functionality?
3. Could we use some of our overhead time or match this to other projects already being assigned (and with budget) to work on adding the needed functionality to what is available?

Strategy and technologies involved
